Teach me about The Foreign exchange

Ultimately the foreign exchange market is the controlled flow of money around the planet; currencies are exchanged one against another, a marketplace where speculators (traders and investors) can profit on the price movements.

Also known as the Forex, FX and even 4X this marketplace is similar to the other financial markets; Shares, CFD or Futures trading, where you buy low and sell higher to profit, likewise you can sell high and buy back low to profit from a falling market (short selling).

This super sized currency market offers high liquidity and high leverage. Smaller margin requirements coupled with technology has flung open the doors to mum and dad investors allowing the general public to delve into a world that was historically only available to banks, large corporations, governments and big time investors.

Although similar to the traditional Share Trading it does have a few unique features. Firstly, you are trading two currencies; comparing the value of one against the other (ones value is rising the others value is decreasing), whereas in share trading the value is only of the individual share. Also as there are two currencies involved, where one is rising and the other is falling there could never be a 'short selling' ban.

What are currency pairs?

Typically the most popular currencies are compared to the US Dollar. Let's look at the Euro Dollar against the US Dollar, in shortened code these two currencies are paired up and quoted like this; EUR/USD (this is by far the most popular currency pair traded).

Check out the Exchange Rate chart following. If the value of 1 Euro Dollar (EUR) is quoted as 1.462 US Dollars, this means that the Euro is much stronger than the US Dollar.

EXCHANGE RATES + Add to Site						
	USD	EUR	GBP	JPY	CAD	AUD
1 USD =	1.000	0.684	0.604	90.909	1.083	1.160
1 EUR =	1.462	1.000	0.883	132.947	1.584	1.697
1 GBP =	1.657	1.133	1.000	150.636	1.794	1.923
1 JPY =	0.011	0.008	0.007	1.000	0.012	0.013
1 CAD =	0.924	0.632	0.557	83.957	1.000	1.072
1 AUD =	0.862	0.589	0.520	78.350	0.933	1.000

Here is the EUR/USD chart. The value of the US Dollar (the counter currency) is quoted on the vertical access, 1.4604, and the Euro Dollar (the base currency) is always valued at 1 and moved along the time line of the horizontal access.

Tell me what PIPS are?

When the bar chart rises, the Euro is strengthening against the US Dollar; or should it fall, it is weakening against the US Dollar.

You will notice that currency prices are quoted with more decimals than the typical two. Shares are quoted in the old dollars and cents fashion, eg; \$1.23 per share. But currencies are quoted with either four or five decimals, this gives more accurate trade execution as the price fluctuations are much smaller, eg; 1.4236.

The movement is measured in PIPS which is different to the typical Dollars, Cents or even Points you hear of in other markets.

The pip movement is the 4th digit after the decimal point. In our example above the price is quoted as 1.4236. In normal dollars and cents the price, rounded down, would be quoted as \$1.42. But in currency trading we look further down the line; if the price moved up by 2 pips, the new price would be quoted as 1.4238.

If it moved up another 10 pips it now would be 1.4248. Now if we brought that price back to the dollars and cents it would still be \$1.42. In total the price moved up by 12 pips.

If the price moved from 1.4248 up another 100 pips, the new price would be 1.4348, (which reflected in dollars and cents would be \$1.43).

This quotation, 1.4348, is called a 4 digit price, some brokers will quote 5 digits so you may see an extra digit on the very right. This is just for more accurate trade execution.

What is leverage?

The price movements of currencies is relatively small, therefore leverage is required to enter into large sizes to make the profit worthwhile. Leverage simply means you are borrowing money to enter into bigger positions and partake in larger profit potential, but this is the same for the loss also.

Similar to when you purchase a home, if you don't have enough cash to purchase the property outright you need to borrow money from a lender. This allows you to gain assets that you otherwise wouldn't be able to afford.

Also known as Margin FX trading and this is because for the general investor to be involved they need to use leverage to be able to enter positions big enough to profit on these tiny price movements. Just like the home investment where you have borrowed money to invest, you need to put up a 'deposit' as security. Well this is the same with Forex trading you need to put up a Margin.

Leverage is chosen within your account and can range from 25:1 all the way up to 300:1 +. So a word of warning, please ensure you chose wisely in accordance to your knowledge level.

How do I open an account to trade?

A foreign exchange trader will place their order through a forex broker. The broker provides an online trading platform, and makes available both live accounts and demo accounts. The demo accounts allow you to trade fictitious funds prior to putting real money on the line.

We recommend 'ForexMeta' or 'GoMarkets' MT4 Brokers, which are both MetaTrader Brokers and allow trading with EA's (Expert Advisors - also known as robots).

www.forexmeta.com/bonus5/ -With special \$500 bonus opportunity using this link!

OR you can try www.gomarketsaus.com

The MT4 trading platform is a FREE charting and trading platform that links into the broker platform which they provide to you via a free download from their website. MetaTrader4 has become very popular with over 300 brokerage firms and banks worldwide using it for their trading services and operations.

GoMarkets offer two types of accounts, which you can choose depending on the level of risk you wish to use. If you want a low risk account try their 'L' Plate account, see following page.

GoMarkets L Plates (Learner Account)

Lot sizes = (1.0 = \$1 per pip), (0.10 = 10 cents per pip), and (0.01 = 1 cent per pip)

This means if your stop loss was set 60 pips from your entry, your total risk for the trade would be 60 cents.

Go Markets Standard Account

Lot sizes = (1.0 = \$10 per pip), (0.10 = \$1 per pip), and (0.01 = 10 cents per pip)

What exactly is trading psychology?

The most critical quality a trader continually needs to improve on, even right across their trading career, is to master their emotions.

We often mislead ourselves into thinking that we are quite calm by nature, with the ability to think clearly, a high level of emotional control, and even low anxiety levels. But during live trading, especially with real money on line, all of your emotions are significantly heightened.

The markets price action is based on Supply and Demand; and is the pure reflection of all market participants' perception and interpretation of external events.

Each person has so many things happening in their life that flows through and influences their trading decisions. It may be that they are trading with their last few thousand dollars and trading from desperation rather than strategy; and they are trying to force money from the market with decisions based upon fear, fear of losing money.

Another trader may have a series of wins and be feeling elated from their success. This causes their ego to inflate and they feel invincible, which in turn has them basing decisions on greed.

Human Nature has us naturally basing our decisions on one or more of these emotions; Fear, Greed, Ego and Hope. And any of these mixed with trading the financial markets, is a recipe for disaster.

When our emotions drive our decisions we are trading from the wrong viewpoint. And we stray too often from the strict guidelines of our Trading Plan.

A trader must trade with the least amount of emotion as possible – and this sound much easier said than done, as our personality is a cluster of emotions that arise throughout each day.

When markets are moving fast the temptation to take profit early if we get nervous, or take a double sized position if we are feeling full of pride, or even the hesitation to not take a trade if we are fearful it may be a losing one; anything outside of your Trading Plan guidelines will in effect change the reflection of what your system can produce.

Doing any of these is disastrous. Even if your sporadic actions temporarily produce a positive result it isn't something you can quantify and measure and therefore repeat again. Or avoid, should it have instead been a negative outcome.

You can certainly tweak and improve your trading plan, and morph with the changing markets but it must be a planned systematic approach where each new result is carefully documented and reviewed for its effectiveness to the overall plan.

Making things up as you go can never be measured and quantified.

How important is a trading plan?

This is the very reason why a Trading Plan is so important; a Trading Plan is a series of rules that identify and foresee many market events with guidelines for the traders' response to these. These rules are what the Infinity Pro robot follows.

*“A Trading Plan is just like any architectural drawing;
it is the blueprint to your success.*

*It is the frame work that
a Trader MUST base ALL decisions;
it premeditates all potential scenarios
with a plan of action for each of these.”*

- Ingela Troha

Many novice traders would assume that a Trading Plan would be limited to things like Entry and Exit Rules but they should cover things as far as;

- Money Management Rules,
- Risk Management Rules,
- Entry Rules,
- Profit Taking Rule,
- Trailing Stop Loss Rule,
- Trade Reversal Rules,
- Trading Psychology Rules, etc.

Forex InFlnlty Pro

Trading SySTem

The Forex Infinity Pro was created on the EURUSD pair, on the 30 minute chart. This pair was chosen as it is the most popular pair, and the 30 minute time frame gave more trades with a little longer runs than the smaller time frames.

- EURUSD pair
- 30 min chart
- Stop Loss = 60 pips
- Take Profit = 110 pips (close 90%)
- Trailing Stop = 21 SMA
- Allow Long / Allow Short

Forex InFlnlty Pro trading tools

- Bar Chart
- 21 period Simple Moving Average

Let's look at a live trade within MetaTrader4.

In the image below, starting from the first bar on the left, we have a bar with the close below the open. The next bar has its close now above the open, which counts as our 1st bar in our 3 consecutive bar count (to enter the market Long). We then have a 2nd and then a 3rd bar each with HH and HL's, and also their close's are above their open's, and the 3rd bar with its close above the 21 period SMA.

The trader can then enter on the open of the bar following. This happens below, and the market starts to weaken slightly. The trade then closes out due to the exit rules being fulfilled, which I will explain for you again soon. Next the market then rises again fulfilling our Long entry rules...

3 consecutive bars with HH and HL's, and also their close above the open, with the 3rd bar must be closing above the 21 period SMA.

This time the trade moves into the traders favour nicely, and closes a portion of the position at the profit target, holding the balance of the trade until the final exit rules.

STOP LOSS

The Forex Infinity has built in risk and money management. This means should the trade go against your favour your stop loss order will automatically close out your position before you lose too much capital.

Stop Loss Setting = 60 pips

This means as soon as the market has reached the point of 60 pips against your trade, it closes out and you have lost 60 pips in total.

Now the dollar value of that depends on the type of account you have and the value per pip movement.

GoMarkets has a Learner Account (L Plate) where the value per pip is 1 cent, so in this case the maximum you could potentially lose per trade is 60 cents per 0.01 lot.

Position sizing and Money Management

Another important way to minimise the potential downside of trading is to never risk more than a certain amount of your overall capital on any one trade.

A good rule of thumb for traders is a maximum of 2% of your total account.

This means if your starting account balance was \$500, you wouldn't risk anymore than \$10 on each trade, ($\$500 \times 2\% = \10).

So if your Stop Loss is set 60 pips from the entry, your potential risk is 60 cents per 0.01 lot in the L Plate account, so to then find out your position size you divide \$10 by 0.60 cents to find out how many lots you can enter into.

$\$10 \text{ divided by } 0.60 \text{ cents} = 16.6$

$0.01 \times 16.6 = 0.16 \text{ lots}$

Take Profit

Another way to reduce your risk is to take profit along the way. This means you are closing out a portion of your trade at a specific level.

Profit Target = 120 pips (to close 90%).

Forex Infinity Pro closes out almost the entire position (90%) at the profit target, leaving a portion still open to continue on and capture a little more profit.

The reason for this is that on the 30 minute chart the 'trends' are much smaller than on the larger time frames, and it proves more profitable to simply close almost the entire position at the Profit Target.

Final Exit

The 21 SMA comes into effect as a trailing stop loss and signals when it is time to close the trade entirely.

The rule is that the trade must close as soon as there is a bar with a "larger range" (than the previous bar) which crosses onto the opposite side of the SMA, the close must now be below the open, plus the open and close must be in opposite 3rds of the bar. What does "larger range" mean?

As it says, the bar just formed must have a larger range than the bar previous to it. The range is the difference between the high and the low of the bar.

Following I have circled the bars which have larger "ranges" than their previous bar from left to right.

So when in a Long trade, once the market has fallen below the 21 SMA and you see a “larger range” bar form (in comparison to its previous bar) you would look for these other indications to then make the final exit;

1. there is a “larger range” bar which has crossed or now resides on the opposite side of the SMA,
2. **plus the close must now be below the open,**
3. **plus the open and close must be in opposite 3rds of the bar.**

Important: Please note that if the conditions are not met immediately as the market starts to fall below the 21 SMA, the trader needs to close as soon as the exit criteria is met.

Short trades

To profit from a falling market with Infinity Pro the rules are simply the opposite, flipped upside down. Here is a summary;

- Enter Short after 3 consecutive bars with LH and LL, closes must be BELOW the opens, and 3rd bar close must be below the 21 SMA.
- Stop loss is 60 pips ABOVE the entry.
- Take Profit 120 pips BELOW the entry.
- Close the trade totally should the market make 1 larger ranged bar ABOVE the 21 SMA, where the close is ABOVE the open and the open & close are in opposite thirds.

Allow long / Allow Short

These functions are the advanced settings of the Infinity Pro ELITE that allow the manual intervention from the trader. Robots can't do everything that a trader can, and with a little more foresight they can be tweaked to perform better.

By identifying the current market conditions Infinity Pro ELITE allows you to use a couple of extra parameters to override the current programming of the robot to optimize the results through either; Long only trades, or short only trades.

To purchase the Infinity Pro ELITE manual for only \$27, [click here](#)

or go to

<https://www.plimus.com/jsp/buynow.jsp?contractId=2533710>

Trade by Trade

Reading from the left in the image below; the first Long trade (blue dotted lines) executes after fulfilling the entry criteria, then nicely moved into favour and takes profit just before the market plummeted, finally closing out at the trailing stop of a 'larger range' below the 21 SMA. (see the small red line on the bottom left of the chart – that is the entry stop loss).

Trade two was actually a Short Trade (short red dotted lines), which closed out at the trailing stop (closing up above the 21 SMA) at a small loss.

The third trade is another Long trade, after fulfilling the entry criteria it again moves nicely into favour then taking profit just before the market went sideways a little, finally closing out at the trailing stop of a 'larger range' below the 21 SMA.

In this next chart image we see two Short trades, with one Long trade in between.
